**WHITE METAL STARTS AGGRESSIVE CHANNEL SAMPLING PROGRAM AT  
THE GUNNERS COVE GOLD PROJECT**

**Thunder Bay, Ontario, August 24, 2018: White Metal Resources Corp. (TSXV:WHM)** (“White Metal” or the “Company”) is pleased to announce that an important channel sampling program has begun on 7 priority targets on its Gunners Cove Gold Property (the “Property”) in Newfoundland. To date, 120 channel samples have been submitted to Eastern Analytical Laboratories in Springdale, Newfoundland and a further 300 samples are expected to be taken in the coming weeks.

The seven priority targets that will be channel sampled include the Thompson Zone, the East and West Gunners Pit (discovery pit), and the Hidden Pit, also located in the Gunners Pit area. Also included in the program is the Stephens Zone, the Totem Zone, and the Bazooka Zone (see White Metal News Release dated July 3, 2018). Grab samples taken across strike at the Bazooka Zone area yielded anomalous gold concentrations over 1000 metres across strike.

Technical personnel for the Company have designed the channel sampling program as the best way to properly evaluate the gold tenure and continuity on the various gold zones as well as assist in the delineation of targets for a future diamond drilling program.

The Gunners Cove Gold Project is a new unexplored gold system that has now been traced intermittently for 18km along strike (N-S) and from 1.3 to 3.0km in width (E-W). To date, 15 new areas of gold mineralization have been discovered of which seven have been identified as high priority targets.

Since the initial gold discovery in September 2017, the Company has had excellent success not only in making new discoveries, but extending the area of gold mineralization substantially at the Gunners Cove Gold Project. Evaluation of the geological controls of the known gold mineralization can be summarized as follows:

- Anomalous and moderate grade gold assays are associated with 2% to 10% pyrite nodules, discontinuous stringers, fragments and cubic crystals.
- The gold zones are hosted in a geological distinctive unit of chaotic, multi-lithic breccia with a predominately graphitic and mudstone matrix. This unit is associated with regional thrust faulting and referred to as a melange.
- The higher pyrite content appears to be associated with well-foliated (sheared) graphitic melange.
- This melange can be mapped over horizontal widths of up to 1.3km, however the full extent of the melange is not understood at this time. The unit appears to be located at the base of a sedimentary-ultramafic package and has been extended as a discontinuous unit over an area measuring approximately 18km by 3km.
- Anomalous silver, copper and molybdenum are also associated with the gold mineralization.

Technical information in this news release has been reviewed and approved by Dr. Scott Jobin-Bevans (P.Geo.), Vice President Exploration and a Director of White Metal, who is a Qualified Person under the definitions established by the National Instrument 43-101.
